

Turnaround Time by Functionality

Game engine timing reference for all key actions and events

The game heartbeat is approximately 1 second — your next turn usually feels like it arrives within a second.

Setup & Infrastructure

Game Start + Process Setup (~1–3s)

Arbiter, HIP, and ASP initialization plus shared memory allocation. Heavier on first launch.

Normal Turn Handover (~0.5–1s)

The scheduler passes control to the next actor. Feels nearly instant in practice.

Player Action Input Screen Render (~instant to 0.5s)

UI draws quickly; delay is mostly rendering pipeline overhead.

Player Actions

Strike (~1–3s)

Most of the time is your button press and target selection. The engine applies the strike almost instantly after confirmation.

Exhaust (~1–3s)

Similar to Strike — interaction time dominates. Engine-side apply is near-instant.

Use Weapon (~2–5s)

Slightly slower because you may need to choose both a weapon and a target. More menu steps mean more turnaround.

Swap In (Long-Term → Inventory) (~1–3s)

Choose a weapon from long-term storage; the game places it and consumes your turn. Feels quick but deliberate.

Move to Long Term (Inventory → Long-Term) (~1–3s)

Select one inventory weapon to move into storage. Turn is spent on completion.

Heal (~1–2s)

A single clean action. Updates are immediate after the key press.

Skip (~0.5–1.5s)

Fastest player action. Minimal interaction with a quick handoff to the next actor.

Ultimate Activation (~1–2s trigger + ~10s effect window)

Activation itself is quick, but its effect window is long — enemy-side freeze lasts around 10 seconds, noticeably changing match flow.

Enemy & Special Events

Enemy Action Decision + Apply (~0.5–1.5s per enemy)

AI decision logic is simple and fast. Delays only occur with special phases or state blocks.

Stun Effect on Target (~3s delay impact)

A stunned unit effectively loses about 3 seconds of responsiveness during its window.

Weapon Drop Prompt / Pickup Decision (~2–8s)

Prompt handling itself is fast — the range reflects human decision time.

Eclipse Relic / Pickup Prompt Flow (~2–8s)

Similar to weapon drop; timing is driven by how quickly the player responds.

Artifact Lock / Deadlock Resolution Prompt (~3–10s)

A decision-heavy interruption. Turnaround is almost entirely human thinking time, not engine overhead.

Kill, Win/Lose & Cleanup

Kill Handling + Log + Respawn (~instant to 1s)

Logic executes immediately; visually it feels almost instantaneous to the player.

HUD / Action Log Update After Action (~instant to 0.5s)

Rendered right away; any perceptible delay is UI refresh overhead only.

Win / Lose Condition Detection (~instant to 1s)

Condition checks run immediately after each action resolves.

Game-Over Transition / Cleanup (~1–3s)

Detection is immediate, but presentation, logging, and teardown make it feel like a short transition.

Start of a Normal Turn (Scheduler Handover) (~0.5–1.0s)

Consistent with the ~1s game heartbeat. Feels reliably snappy during normal play.

Enemy Respawn After Kill (~instant to ~1s)

Logic is immediate; the visual feel is nearly instant on screen.

Game Over / Victory Transition (~1–2s)

Condition checks are immediate; presentation and logging create the perceived short pause.

Game Screenshots

P2 Action Menu — Strike, Exhaust, Use Weapon options with inventory and artifact status

P2 Action — Eclipse Relic pickup and Frostbow moved to long-term storage

P1 Action Menu — Full enemy wave visible, both players at READY status

Enemy Turn — E3 skips turn; P2 (Lee) showing STUN 1.2s status

Weapon Drop Prompt — Lunar Blade pickup decision with 3.0s countdown timer

Deadlock Screen — Solar Core vs Lunar Blade conflict resolution with 58s timer
